

FROM OUR PASTOR

February 11, 2017

Last weekend while much of the world was preoccupied watching a football game, with a half time show featuring Lady Gaga channeling Satanic symbolism, a developing catastrophe which could affect half of the world was reported by the UK Guardian. As usual, media in the US pretty much ignored the alarming news, but FOXNEWS did report a short bit. "The radiation levels at Japan's crippled Fukushima nuclear power plant are now at "unimaginable" levels. (Tepco)... said this morning that new fuel leaks have been discovered. The radiation levels - as high as 530 sieverts per hour - are now the highest they've been since 2011 when a tsunami hit the coastal reactor."

The Fukushima nuclear accident just got a whole lot worse, much worse. Combined with the insanely dangerous levels of radiation measured, experts have detected a three foot wide hole in the floor of the containment structure of reactor No. 2, allowing decaying fuel material to melt into the ground. This was not supposed to happen.

Forgive me for being personal here, but I worked for three years as an engineer in nuclear power plants. During that time I spent many days suited up in protective gear in radioactive areas and did development work on the liquid sodium cooled FFTF--the most advanced reactor ever built. I also worked in the Plutonium Finishing Z plant, one of the most guarded and top-secret buildings in the world. This Fukashima news is cause for alarm.

A sievert is a unit of radiation exposure, and exposure to just five sieverts in a short amount of time has a 50% kill rate among humans. Absorbing five sieverts of radiation over a year's time is not fatal, but exposure to five sieverts in just 60 seconds, for example, will almost certainly kill you from radiation poisoning.

The level of radiation measured inside Fukushima reactor No. 2 would mean certain death for any human exposed for even a few seconds, and scientists report that it will fry robots used for cleanup in an hour or two. The big problem now is that the melted fuel rods which are generating this radiation have apparently bored a hole through the floor of the containment vessel. They are likely very close to coming into contact with ground water or ocean water. If it does, it will create radioactive steam explosions, resulting in a cloud like the world has never seen before.

NaturalNews reported: "Yet nearly the entire mainstream media remains in a complete news blackout over this devastating development that threatens the sustainability of all life in the Northern hemisphere."

While there is no danger of a nuclear explosion (as some have incorrectly reported) there is incredible danger of massive amounts of radioactive material being released into the atmosphere if these fuel rods come into contact with water. Since the fuel has burned through the concrete floor, there is almost no way to contain it. Plus no one knows what is going on in the other two burning reactors. How long will it last? Some of that fuel contains plutonium-239 that boasts a half life of 24,000 years. It will be around for a very long time. No one has a solution so far.

Our Creator long ago knew that mankind would corrupt this physical world and that the creation would need to be delivered, or restored, when Jesus Christ returns.

The Apostle Paul wrote to the church in Rome: "The creation itself also will be delivered from the bondage of corruption into the glorious liberty of the children of God. For we know that the whole creation groans and labors with birth pangs together until now. (Romans 8:21-22). The "bondage of corruption" is more obvious with every passing day.
