

From Our Pastor January 12, 2019

Sabbath Greetings to everyone! Though little reported, on March 29, 2018 the FCC gave approval to SpaceX, to launch 4,425 satellites into low orbit around the Earth. The total number of satellites expected to be put into low and high orbit will be 20,000 satellites. In addition, the plans are to install millions--yes millions-- of small cell towers on electric utility poles, on public buildings and schools, on bus stop shelters, in public parks, and anywhere they want in national parks and on federally owned land. The goal is to have a cell tower every 500 feet anywhere people live. Why?

5G, or 5th generation cell phone technology is already being deployed. Satellites and towers will send tightly focused beams of intense microwave radiation at each specific 5G device that is on the Earth and each device will send a beam of radiation back to the satellite. 5G will be at least fifty times faster than current 4G signals, but should we be concerned? Current 4G beams use a radio wavelength of six to eighteen inches. 5G's use a higher frequency band, operating at millimeter wave (mmWave) bands on the radio spectrum. That aspect of the 5G architecture will make great amounts of bandwidth available and overcome 4G's traffic congestion issues. The aim of 5G is to achieve 1000 times the capacity of 4G.

According to J.P. Thomas of HealthImpactNews.com, "The much shorter length microwaves used for 5G will make it possible to use small phased array antennas to send and receive signals. Phased array antennas consist of clusters of hundreds of tiny antennas that work together to shoot a ray of energy at a target just like a bullet. A cluster of these tiny antennas can be arranged in a 4 inch by 4 inch matrix. The rays of microwaves they produce will be strong enough to pass through walls and human bodies. Each 5G product will also have multiple phased array antennas which will be used to create a powerful beam of radiation back to the 5G devices mounted on electrical utility poles or toward a specific satellite in space. These beams of radiation will also need to be strong enough to pass through walls and human flesh such as a hand or head to reach the intended destination.

This means that if you are in a crowded location, such as an airport or on a train, there will be hundreds if not thousands of invisible beams of radiation flying through the environment at the speed of light. As people move in that environment, their bodies will be penetrated by numerous beams of radiation as they walk or as other people walk around them with their 5G smart phones. The effective radiated power of the 5G phased array antennas in phones will be 10 times more powerful than 4G phones. No one will be free from exposure.

In addition, 5G beams of microwave radiation will be received and transmitted from new computer equipment, household appliances, and automobiles. Stationary equipment such as Wi-Fi hubs in homes and offices will be permitted to use microwave beams that

are 15 times stronger (300 watts) than the signals from 5G phones or 150 times stronger than 4G phones."

The Frequency Spectrum is the full range of electromagnetic radiation. Wavelength varies from very long radio waves of many feet in wavelength (such as used by broadcast Television) to microwaves, infrared, visible, ultraviolet, x-rays and gamma rays, which have a wavelength less than the size of an atom. All are dangerous to the human body in concentrated amounts.

Current cell phone signals are suspected at causing brain tumors or other health problems. The American Cancer Society has posted concerns for the past decade. One recent report says, "several studies published by ..a.. research group in Sweden have reported an increased risk of tumors on the side of the head where the cell phone was held, particularly with 10 or more years of use."

One would assume that complete testing has been performed on 5G signals and they are completely safe. Not so. DefenderShield.com states, "5G network EMF radiation emissions have in no way whatsoever been tested for short or long-term effects on human health. Considering what we know now about the effects of 4G and WIFI, this is a major oversight." 5G also helps Big Brother. Every source if a signal can be tracked and recorded, and the projection is 75 billion items will be connected to the Internet by 2025. Privacy will be a thing of the past in civilized society. Whether we want it or not, the next generation of wireless is fast approaching, with virtually nothing standing between us and the widespread implementation of this powerful and untested technology.

The soon coming one-world government will perhaps use this new power to control people. We are told in Revelation 13, "He causes all, both small and great, rich and poor, free and slave, to receive a mark on their right hand or on their foreheads, and that no one may buy or sell except one who has the mark or the name of the beast, or the number of his name. " (verses 16-17) The new technology might make this fairly easy to accomplish.
